

Confirmed cases of VOC-21APR-02 by week

All cases are confirmed. We do not report provisional cases.

Due to a time lag in sequencing (approximately 10 to 14 days) and the prioritisation of samples of concern, variants cases can be identified many weeks after the sample date (hence new cases 5 to 6 weeks ago).

The numbers on top of the bars are number of new cases (not cumulative total for each week).
