## Pricing complex care

Characteristic(s) / CSF(s):

Managing Expenditure

Use of Digital and Technology

Use of Data and Intelligence

### Problem and Approach

- For both care commissioners and care providers objectively calculating the fair price for a package of care is difficult. Even more so for bespoke complex packages of care.
- Care<sup>3</sup> has over 10 years of research and applied experience. It brings national and local data together into a simple desktop and mobile application that allows a care worker to calculate the fair price for a package of care at any address in Great Britain. The application is easy to use for care workers and service providers, using a series of plain English questions to interrogate the data and provide a fair care cost. The application is even more powerful in reducing the effort of monitoring the care package, in particular where there is an improvement plan for the client

### Outcomes

- On average the price of placements after using the tool has been 15% less
- The tool brings transparency to customer needs and achieves a better price without reducing margins of suppliers
- There have been judicial reviews of the price paid for care packages because there has been no justification for the price. The robust method and local and national data driven approach removes this concern.
- The tool allows the care worker to make informed decisions without the need for technical or procurement expertise, releasing time for more important tasks
